

Advantages of Function:

1) Modularity:

Dividing the bigger task into number of smaller tasks.

2) Easy to understand:

Once the task is divided into number of independent modules then it is easy to understand the entire module.

3) Reusability:

We can reuse a particular module for 'n' number of times.

Note: In java, we always reuse our java classes.

4) Easy debugging:

Each module is isolated from another module so the debugging is easy because we can debug only one module where we have syntax or semantics error.

Why we pass parameter to a function?

We should pass parameter to a function for getting more information regarding the function.

If We don't pass parameter then the information's are not complete, it is partial information.

Example:

```
public void deposit (double amount)
{
}

public void sum (int x, int y)
{
}

public void sleep (int hours)
{
}
```

Why functions are called Method in java?

In C++ language, there is a facility to write a function inside the class as well outside of the class by using scope resolution operator (::) but in java we can write a function **inside the class only**, we can't define a function outside of the class, that is reason functions are called Method in java.

From JDK 25V we can write a method without class which is known as "**Compact source file**" but here internally compiler is generating a final class which is based on the java file name.

****What is platform independency in java?**

C and C++ programs are **platform dependent** programs that means the .exe file created on one machine will not be executed on another machine if the system configuration is different.

That is the reason C and C++ programs are not suitable for website development.
